

Fix / Change Log

Manly Remedial & Thai Massage — clinic management app · generated 2026-08-11

A running record of everything asked of Claude to fix, add, or investigate in this repo — so it's easy to recognize "have I already asked for this?" or "was this already fixed?", and to see at a glance what's still waiting on real-world confirmation, without digging back through chat history.

Open follow-ups

None — every fix below was verified live before being marked Done.

Backlog — found during QA, not yet actioned

Surfaced by the 2026-08-11 deep-testing pass, not yet requested as a fix:

- Couple-booking confirmation screen (/portal/bookings/confirmed) only shows the primary service/price, not the partner half or the combined total (both bookings ARE created correctly — display-only).
- Walk-in voucher form (/staff/vouchers/new) requires a recipient email even though its own copy says "print it and hand it over" is an option.
- CLAUDE.md says every customer booking captures a fresh signature; code (by design) only requires one for pregnancy/health-fund bookings — doc drift.
- /portal/bookings/[id]/reschedule moves the booking on a single click with no "confirm this move?" step.

Log

DATE	ASKED	ISSUE FOUND	RESULT / FIX	STATUS	FOLLOW-UP	REF
2026-08-11	Staff calendar (/staff/schedule) only lets you step one day at a time via the < > arrows; asked for a way to jump straight to a date (e.g. 15 days out)	N/A — feature request	Added a clickable date label next to the clock icon in DateNav that opens the browser's native date picker; picking a date navigates straight to ? date=... . Verified working locally and live on production.	✓ Done	—	components/staff-shell.tsx commit a2d5b6a
2026-08-11	Use Fable 5 to deep-test the site — customer view, staff view, audit view — assuming the site is live even under maintenance mode	N/A — testing/investigation request	Ran 3 parallel Fable 5 QA agents: deep functional testing (real submissions, synthetic data) against local dev, plus a read-only pass against production with maintenance-mode bypass via the existing staff-session/preview-token mechanism. Surfaced 6 real bugs (rows below) plus 4 lower-priority backlog items (see Backlog section above).	✓ Done	—	3 agent runs (customer-facing, staff portal, audit-logging)
2026-08-11	Fix the audit-logging gap found during testing	/staff/bookings/[id] only wrote a VIEW_HEALTH_INFO audit entry when the client had an IntakeForm on file — a booking for a client	Logging now happens unconditionally; resource points at the Booking itself (not the client's	✓ Done	—	app/(portal)/staff/bookings/[id]/page.tsx commit 048d8fe

DATE	ASKED	ISSUE FOUND	RESULT / FIX	STATUS	FOLLOW-UP	REF
		with no intake at all (clinical notes, annotations, contact details all visible) left zero audit trail	possibly-unrelated latest intake), with the intake id carried in metadata instead			
2026-08-11	(same batch) fix the literal "." text bug found on the clinical notes form	In an uncommitted in-progress feature (chip-based SOAP note builder), "." was sitting as raw JSX text outside any JS string, so it rendered the literal 6 characters instead of a "." separator	Wrapped in <code>{"."}</code> so the escape is interpreted at runtime	✓ Done	—	<code>.../clinical-notes-form.tsx</code> commit <code>ff76db9</code>
2026-08-11	(same batch) fix the Block Time dialog defaulting to the wrong day	<code>date</code> state was seeded once via <code>useState(dateStr)</code> at mount and only resynced on dialog close; navigating to a different day (via arrows or the new date-picker) then opening the dialog silently kept the originally-loaded day	Added <code>openDialog()</code> that resyncs <code>date</code> to the currently-viewed <code>dateStr</code> every time the dialog is opened	✓ Done	—	<code>.../block-time-dialog.tsx</code> commit <code>36e07fd</code>
2026-08-11	Fix the couple-booking race (HIGH) — ticking "booking for two" then clicking quickly could silently produce a solo booking	Two compounding bugs: (1) the date-tab links in <code>page.tsx</code> never included <code>&partner=</code> at all, unconditionally — not just a timing issue; (2) both date tabs and slot links were built from server-rendered props that lag behind the URL for a moment right after the couple checkbox's <code>router.push</code>	Extracted date tabs into a new <code>date-tabs.tsx</code> client component reading <code>partner</code> live from <code>useSearchParams()</code> ; <code>slot-picker.tsx</code> now also prefers the live URL value over the (possibly stale) prop	✓ Done	—	<code>date-tabs.tsx</code> (new) <code>page.tsx</code> , <code>slot-picker.tsx</code> commit <code>9f8eade</code>
2026-08-11	Fix the therapist real-name fallback	<code>therapistPublicName()</code> fell back to the therapist's real name whenever <code>displayName</code> was unset. The "Add Therapist" form never collects a display name, so this wasn't a rare edge case — it's the default state for every newly added therapist until an admin manually sets one	Fallback changed to a safe <code>Staff <ID></code> placeholder instead of the real name; added optional <code>id</code> to <code>TherapistNameish</code> ; corrected the stale <code>schema.prisma</code> comment that had documented the old (unsafe) behaviour as intentional	✓ Done	—	<code>lib/utils.ts</code> , <code>schema.prisma</code> (comment) commit <code>c5194e6</code>
2026-08-11	Fix the submit-time session mismatch	<code>createBooking()</code> re-read <code>auth()</code> fresh at submit time with no check against the session shown on page load ("Booked under X"). If a different account signed in on another browser tab before submit, the booking and health intake silently saved	<code>createBooking</code> now compares <code>_signedInEmail</code> (captured at page load) against the current session's email at submit, and rejects with a clear message on mismatch. The legitimate "Not	✓ Done	—	<code>book/confirm/actions.ts</code> commit <code>90c4da3</code>
